

## Definition: Probability Axioms

Let  $S$  be a sample space,  $E \subseteq S$  be any event and a function  $P$  satisfying the following properties

- $P(E) \in [0, 1]$
- $P(S) = 1$
- For disjoint events  $E_1, E_2, E_3, \dots$

$$P\left(\bigcup_{i=1}^{\infty} E_i\right) = \sum_{i=1}^{\infty} P(E_i)$$

Then we denote  $P(E)$  as the probability of the event  $E$

## Remarks

- Set  $E_1 = S$  and for every  $i \in \mathbb{N}^{\geq 2}$ ,  $E_i = \emptyset$ , and note that any set and the empty set are disjoint, therefore by the third axiom one sees that  $P(S) = \sum_{i=1}^{\infty} P(E_i) = P(S) + \sum_{i=2}^{\infty} P(\emptyset)$  Thus  $P(\emptyset) = 0$
- Following that, the third axiom allows us to talk about a finite number of disjoint sets  $E_1, E_2, \dots, E_{n-1}, E_n$  as well, to do so, set each each  $E_i = \emptyset$  for  $i > n$  to get  $P(\bigcup_{i=1}^n E_i) = P(\bigcup_{i=1}^{\infty} E_i) = \sum_{i=1}^n P(E_i) + \sum_{i=n+1}^{\infty} P(\emptyset) = \sum_{i=1}^n P(E_i)$
