## Theorem: Number of Elements in a Finite Union

Let  $X_1, X_2, \ldots, X_{n-1}, X_n \subseteq U$  let's set N(S) = |S| for any set S, the following holds

$$N(X_{1} \cup X_{2} \cup \dots \cup X_{n-1} \cup X_{n}) = \sum_{i=1}^{n} N(X_{i})$$

$$- \sum_{0 \leq i_{1} < i_{2} \leq n} N(X_{i_{1}} \cap X_{i_{2}})$$

$$+ \sum_{0 \leq i_{1} < i_{2} < i_{3} \leq n} N(X_{i_{1}} \cap X_{i_{2}} \cap X_{i_{3}})$$

$$\vdots$$

$$+ (-1)^{r+1} \sum_{0 \leq i_{1} < i_{2} < \dots < i_{r} \leq n} N(X_{i_{1}} \cap X_{i_{2}} \cap \dots \cap X_{i_{r-1}} \cap X_{i_{r}})$$

$$\vdots$$

$$+ (-1)^{n+1} N\left(\bigcap_{i=1}^{n} X_{i}\right)$$

## Proof -

- To prove that these two numbers are equal, we start with the fact that the left hand side simply counts the number elements in the set  $\bigcup_{i=1}^{n} X_i$ , to show that that the number on the right hand side is equal to that, we will also show that it counts the number of elements in the set  $\bigcup_{i=1}^{n} X_i$ . That is, let  $a \in \bigcup_{i=1}^{n} X_i$ , we know that the left hand side only counts this element once, let's show the right hand side only counts this element once.
  - $\textit{ Since } a \in \bigcup_{i=1}^n X_i, \textit{ then there exists } X_{\alpha_1}, X_{\alpha_2} \dots X_{\alpha_k}, X_{\beta_1}, X_{\beta_2} \dots X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ and } a \not \in X_{\beta_1} \cap X_{\beta_2} \cap \dots \cap X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ and } a \not \in X_{\beta_1} \cap X_{\beta_2} \cap \dots \cap X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ and } a \not \in X_{\beta_1} \cap X_{\beta_2} \cap \dots \cap X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ and } a \not \in X_{\beta_1} \cap X_{\beta_2} \cap \dots \cap X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ and } a \not \in X_{\beta_1} \cap X_{\beta_2} \cap \dots \cap X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ and } a \not \in X_{\beta_1} \cap X_{\beta_2} \cap \dots \cap X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ and } a \not \in X_{\beta_1} \cap X_{\beta_2} \cap \dots \cap X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ and } a \not \in X_{\beta_1} \cap X_{\beta_2} \cap \dots \cap X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ and } a \not \in X_{\beta_1} \cap X_{\beta_2} \cap \dots \cap X_{\beta_o} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \textit{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \text{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \text{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \cap X_{\alpha_k} \cap \dots \cap X_{\alpha_k} \text{ such that } a \in X_{\alpha_1} \cap X_{\alpha_2} \cap \dots \cap X_{\alpha_k} \cap X_{$ 
    - \* If this is the case then the sum  $\sum_{i=1}^{n} N(X_i)$  over counts a k times, this is because a counted for each  $X_{\alpha_j}$ , as  $a \in X_{\alpha_j}$
    - \* We consider the following sum  $\sum_{0 \le i_1 < i_2 \le n} N(X_{i_1} \cap X_{i_2})$ . We know that  $a \in X_{\alpha_j} \cap X_{\alpha_l}$  for any  $\alpha_j, \alpha_l \in \{\alpha_1, \alpha_2, \dots, \alpha_{k-1}, \alpha_k\}$ . We notice that the number of ways to choose two elements from the set  $\{\alpha_1, \alpha_2, \dots, \alpha_{k-1}, \alpha_k\}$  is simply  $\binom{k}{2}$  thus this represents the number of times that a was over counted by this sum. Notice that we are subtracting this number.
      - · Also note that if we must choose two elements from  $\{\alpha_1, \alpha_2, \dots, \alpha_{k-1}, \alpha_k\}$ , as if we had chosen at least one from  $\{\beta_1, \beta_2, \dots, \beta_{o-1}, \beta_o\}$ , then  $a \notin X_o \cap X_{\beta_t}$
    - \* Following the same logic, we see that if  $a \in X_{\alpha_i} \cap X_{\alpha_l} \cap X_{\alpha_m}$  then the third summation will over count  $\binom{k}{3}$  times.
    - \* Thus the *i*-th sum will over count  $\binom{k}{i}$  times.
- Now to see how many times the right hand side counts a we will simply sum all of the ways it counts it (taking into account the subtractions and additions like in the original summation) to see that it looks like:

$$\sum_{i=1}^{n} \left(-1\right)^{i+1} \binom{k}{i}$$

- Noting that when  $i > k \binom{k}{i} = 0$ , so really, that is:

$$\sum_{i=1}^{k} (-1)^{i+1} \binom{k}{i}$$

• Recall that the binomial theorem tells us about a sum starting from 0, namely that

$$(x+y)^k = \sum_{i=0}^k \binom{k}{i} x^i y^{k-i}$$

• We attempt to manipulate this sum to answer our question about how many times the right hand side counts a. By letting x = -1, y = 1 we see that

$$0 = \sum_{i=0}^{k} (-1)^{i} {k \choose i} = 1 + \sum_{i=1}^{k} (-1)^{i} {k \choose i} \Leftrightarrow 1 = \sum_{i=1}^{k} (-1)^{i+1} {k \choose i}$$

Therefore the right hand side of only counts a once, as required.
